

WS401

| BACKGROUND

The world population has drastically increased from 5.7 billion in 1994 to an estimated 7.7 billion in 2019. According to the 2017 World Population Prospects,[1] the number is expected to reach 11.2 billion in 2100, with the growth being attributed to declining mortality, high fertility rates in some parts of the world and demographic momentum. The world population is currently subjected to mega-trends with a larger, older, more mobile and concentrated population.

Characterized by a gradual shift in the age distribution towards older ages, an ageing population arises from this decreasing fertility trend and increased life expectancy. A result of declining fertility and increased longevity is the so-called global population ageing. The number of older persons (defined as over the age of 60) is expected to increase by 229% in Africa, followed by Latin America and the Caribbean (161%) and Asia (132%) between 2017 and 2050.[2]

Based on existing, agreed-on global mandates, a collective response requires a life-course approach, as well as a strong primary health care approach for promoting health and preventing disease at all ages, and ensuring the inclusion of health services within Universal Health Coverage (UHC) – including long-term care at home, in communities and when needed, within institutions – without financial burden[3].

COVID-19 has had wide demographic implications, including increased mortality rates, a disproportionate impact on the mortality of older persons, and increased vulnerability of certain migrant groups. The session highlights these groups disadvantaged by the impacts of COVID-19, though highlight the way forwards, suggesting the future of the society.

| OBJECTIVES

To explore the possible changes and the way forward on impacts of COVID-19 on population dynamics, particularly on urbanisation, immigration, ageing, and fertility behaviours.

Speaker

Elizabeth Wilkins

Doctorante

INED, l'Institut national d'études démographiques, Paris France

Elizabeth Wilkins is a PhD candidate, based at INED – the French National Institute for Demographic Studies – in Paris. Her research focuses on the impact of grandparental childcare support on parents' fertility intentions in Asian and European settings, using Generations and Gender Survey (GGS) data.

Since 2018, Elizabeth has served as a Consultant for the United Nations Population Fund (UNFPA), conducting research on population ageing and low fertility, and supporting Member States to develop rights-based population policies in the context of population ageing and low fertility. Recently, she worked to develop the first national population policy for the Republic of Mauritius.

Elizabeth holds a BA in Human Sciences from the University of Oxford, and a MSc in Population and Development from the London School of Economics and Political Science.
