

**WS401**

**THE FUTURE SOCIETY - POPULATION DYNAMICS FOLLOWING COVID-19**

## | BACKGROUND

The world population has drastically increased from 5.7 billion in 1994 to an estimated 7.7 billion in 2019. According to the 2017 World Population Prospects,[1] the number is expected to reach 11.2 billion in 2100, with the growth being attributed to declining mortality, high fertility rates in some parts of the world and demographic momentum. The world population is currently subjected to mega-trends with a larger, older, more mobile and concentrated population.

Characterized by a gradual shift in the age distribution towards older ages, an ageing population arises from this decreasing fertility trend and increased life expectancy. A result of declining fertility and increased longevity is the so-called global population ageing. The number of older persons (defined as over the age of 60) is expected to increase by 229% in Africa, followed by Latin America and the Caribbean (161%) and Asia (132%) between 2017 and 2050.[2]

Based on existing, agreed-on global mandates, a collective response requires a life-course approach, as well as a strong primary health care approach for promoting health and preventing disease at all ages, and ensuring the inclusion of health services within Universal Health Coverage (UHC) – including long-term care at home, in communities and when needed, within institutions – without financial burden[3].

COVID-19 has had wide demographic implications, including increased mortality rates, a disproportionate impact on the mortality of older persons, and increased vulnerability of certain migrant groups. The session highlights these groups disadvantaged by the impacts of COVID-19, though highlight the way forwards, suggesting the future of the society.

## | OBJECTIVES

To explore the possible changes and the way forward on impacts of COVID-19 on population dynamics, particularly on urbanisation, immigration, ageing, and fertility behaviours.

Speaker

## Adelina Comas-Herrera

*Assistant Professorial Research Fellow, the Care Policy and Evaluation Centre*

London School of Economics  
United Kingdom

Adelina Comas-Herrera is co-lead of the Strengthening Responses to Dementia in Developing Countries (STRiDE) project. Funded by the Research Councils UK Global Challenges Research Fund, STRiDE is a multi-national project covering Brazil, India, Indonesia, Jamaica, Kenya, Mexico, and South Africa. The project aims to build capacity to generate research that supports the development of policy responses to dementia, with related projects also under way in Hong Kong and New Zealand. She is the curator of LTCcovid.org, an initiative linked to International Long-Term Care Policy Network that shares evidence and resources to mitigate the impact of COVID-19 amongst those who use and provide long-term care.

Her main research interests are economic aspects of care, treatment and support of people with dementia, and long-term care financing, both in the UK and globally. She has extensive experience in developing simulation models of the future resources required to address long-term care needs and needs arising from dementia.

She has a background in Economics (BA and MSc, Universitat Pompeu Fabra) and is currently Assistant Professorial Research Fellow at the Care Policy and Evaluation Centre at the London School of Economics and Political Science.

She has been a consultant for the Inter-American Development Bank's ageing and long-term care programme and for the World Health Organisation's Department of Ageing and Life Course, preparing a country self-assessment tool for long-term care. She was a co-author of the 2016 and 2019 editions of the World Alzheimer Report.
