**BEYOND BUILDING BACK BETTER - A HEALTHIER AND GREENER WORLD AFTER** THE COVID-19

### | BACKGROUND

The COVID-19 pandemic is having a major impact on people's health, the economy and societies at large. There is huge uncertainty about the future and the implications for sustainable development. Yet, the current crisis presents a number of policy windows - areas where problems, solutions and politics will align. There are thus opportunities beyond building back better, maximizing the co-benefits of addressing climate change, pollution and biodiversity loss, food systems and improving population health. How do we build back greener and healthier?

The effects of COVID-19 have led to discussions regarding human dependence on the planet's ecosystems; a need for recognition of the dependence on ecosystem services, the impact of human development from this and acceptance of the responsibility towards future generations. The health risks of the pandemic are substantial, but so are the potential beneficial effects on health as a result of a radical climate change mitigation and adaptation. Major near-term co-benefits can arise through several pathways.

One main area is related to air pollution; 7 million premature deaths yearly are caused by combined effects from outdoor and household air pollution, according to WHO. Air pollution not only substantially contributes to the four top noncommunicable diseases - stroke, lung cancer, chronic respiratory disease, and heart disease - but is also responsible for 50% of childhood pneumonia deaths. Reduced air pollution through reduced use of fossil fuels can thus provide rapid health benefits.

Another related area of great impact is our present food system, which accounts for a significant part of greenhouse gas emissions and the burden of mortality and morbidity. The COVID-19 pandemic is compromising nutrition globally, and particularly in low-income and middle-income countries. The combined effect of COVID-19 and the mitigation strategies to respond to the pandemic-including social distancing, school closures, trade restrictions, and country lockdowns-are impacting our food systems and has laid bare its fragility: Food systems may produce a health impact by facilitating the diffusion of zoonotic pathogens in human populations, and the use of antibiotics in livestock breeding and aquaculture contributes to antimicrobial resistance that severely threatens human health. Globally, food systems account for between 19-29% of global greenhouse gas emissions, and food waste remains a significant challenge, particularly in high and middleincome countries, with up to a third of food lost across supply chains. How do we change the dietary habits towards more nutritious and healthy food, and how do we provide food for 10 billion people in 2050 without using food systems that undermine the earth's resources and further contribute to climate change, soil and water pollution, biodiversity loss, and food waste? In addition, the Lancet Commission on the global syndemic of obesity, undernutrition, and climate change "argues for understanding 'systemic drivers that need common actions', proposing that tearing down silos in the academy and health policy, strengthening government action and community voices, dismantling corporate power to better designate who eats what and where, and promoting improved, more sustainable business models for a healthier future should be syndemic.". The EAT-Lancet Commission also discusses strategies on the overlaps of food systems and climate change mitigation.

Children and adolescents have greater vulnerability than adults due to several factors, both environmental, physiological, anatomical, cognitive and psychological, related to the phase of development in which they are (Stanberry L.R). Thus, special attention needs to be directed to nutritional needs and sustainable diets of children and adolescents, as well as creating platforms for the younger population for their voices and interests to be acted upon in all areas.

In conclusion, this session will use a multisectoral approach to discuss possibilities on how to build back greener and reap the co-benefits of a fundamental and radical green and healthy recovery. Scientists agree that transforming our food systems is among the most powerful ways to change course and realize the vision of the 2030 Agenda. How do we create multi-level conversations and action to improve equal progress towards Agenda 2030, in the light of COVID-19?

### | OBJECTIVES

The aim of this session is to discuss the linkages and syndemics across climate change, environment, food systems and health. Thus, this session will:

•Explore the evidence of, and linkages and syndemics among, various sectors to identify synergies and trade-offs with the SDG perspective according to different contexts;

•Demonstrate positive examples from different country perspectives on resilience, sustainability and transitions in the

COVID-19 era; and

•Identify ways of how government, civil society and business can work together

#### Speaker

# Agnes Kalibata

*Special Envoy of the United Nations Secretary-General for the 2021 Food Systems Summit* 

United Nations Rwanda

As the UN Secretary-General's Special Envoy, Dr. Kalibata works with the United Nations system and key partners to provide leadership, guidance, and strategic direction towards the 2021 Food Systems Summit. She is responsible for outreach and cooperation with key leaders, including governments, to ensure the Summit serves as a catalytic process within the Decade of Action to improve food systems around the world to deliver on the Sustainable Development Goals (SDGs) and Paris Agreement.

Since 2014, Dr. Kalibata has also served as President of the Alliance for a Green Revolution in Africa (AGRA), where she leads the organization's efforts with public and private partners to ensure a food secure and prosperous Africa through rapid, sustainable agricultural growth, improving the productivity and livelihoods of millions of smallholder farmers in Africa.

Prior to joining AGRA in September 2014, Dr. Kalibata was Rwanda's Minister of Agriculture and Animal Resources (MINAGRI) from 2008 to 2014, where she drove programs that moved her country from a food insecure to a food secure status and became a reference point for other countries that sought to deliver agriculture transformation. Dr. Kalibata has held several other leadership positions, including Permanent Secretary of Ministry of Agriculture and Deputy Vice Chancellor of University of Rwanda. She also worked for the International Institute of Tropical Agriculture in Uganda, and various other agricultural development organizations. She sits on various boards, councils and commissions including the Global Commission on Adaptation, the Global Commission on the Economy and Climate, the Global Panel for Agriculture & Food Systems for Nutrition, the Global Agriculture & Food Security Program (GAFSP), the Global Agenda Council of the World Economic Forum, the Malabo-Montpellier Panel, and Africa Risk Capacity, among others.

Dr. Kalibata has a distinguished track record as an agricultural scientist, policy maker and thought leader. She was awarded the Yara Prize, now the Africa Food Prize, in 2012, an Honorary Doctorate from the University of Liège in 2018, an Honorary Doctorate from McGill University in 2019, and the National Academy of Sciences' Public Welfare Medal in April, 2019 for her work to drive Africa's agricultural transformation through modern sciences and effective policy thereby improving livelihoods of stallholder farmers. Dr. Kalibata holds a doctorate in Entomology from the University of Massa
