Climate resilient and environmentally sustainable health systems: special focus on health care facilities
WHO Guidance on climate-resilient and environmentally sustainable health care facilities

GOALS
To increase the climate resilience of health care facilities to protect and improve the health of their communities in an unstable and changing climate, while optimizing the use of resources and minimizing the release of wastes by becoming environmentally sustainable.

OBJECTIVES
• Guide professionals working in health care settings to understand and effectively prepare for the additional health risks posed by climate change.

• Monitor, anticipate, manage and adapt to the health risks associated with climate change.

• Guide health care facility officials to work with health determining sectors (including water and sanitation, energy, transportation, food, urban planning, environment).

• Provide tools to assist health care facility officials assess their resilience to climate change threats, and their environmental sustainability.

• Promote actions to ensure that health care facilities are constantly and increasingly strengthened and continue to be efficient and responsive to improve health and contribute to reducing inequities and vulnerability within their local settings.
Climate resilience and environmental sustainability in health care facilities
Four fundamental requirements for providing safe and quality care

**HEALTH WORKFORCE:**
adequate numbers of skilled human resources with decent working conditions, empowered and informed to respond to these environmental challenges.

**WATER, SANITATION, HYGIENE AND HEALTH CARE WASTE MANAGEMENT:**
sustainable and safe management of water, sanitation and health care waste services.

**ENERGY:**
sustainable energy services.

**INFRASTRUCTURE, TECHNOLOGIES AND PRODUCTS:**
appropriate infrastructure, technologies, products and processes, including all the operations that allow for the efficient functioning of the health care facility.
Framework for building climate resilient and environmentally sustainable health care facilities
Climate resilience in health care facilities
Risk Reduction in health care facilities

- **Vulnerabilities**
- **Community interventions**
- **Risk** reduction through reduced hazards, exposures, vulnerabilities

**Interventions for environmental sustainability**
- Safe, sufficient & skilled workforce
- Optimal water use
- Optimal energy use
- Sustainable health care infrastructure & technologies

**Interventions for patients, health workers and community**

- **Vulnerability**
- **Exposure**
- **Risk**

**Interventions for health care facilities**

- Hazards
  - Health care wastes, chemicals, radioactive materials, wastewater, air pollution, GHGs, etc.
Example 1: HEALTH WORKFORCE OBJECTIVES

Health workers have a key role in building climate resilience and environmental sustainability of health care facilities. Because building climate resilience and environmental sustainability are relatively new approaches for health workers, building awareness, training and empowering health workers are key requirements for the successful implementation of interventions.

OBJECTIVES FOR THE IMPLEMENTATION OF THIS COMPONENT

**Human resources**: Health care facilities having sufficient number of health workers with healthy and safe working conditions, capacity to deal with health risks from climate change, as well as the awareness and empowerment to ensure environmentally sustainable actions.

**Capacity development**: Training, information and knowledge management targeted at health care workers to respond to climate risks and minimize environmental threats resulting from the operation of the health care facility.

**Communication and awareness raising**: Communicate, coordinate and increase awareness related to climate resilience and environmental sustainability among health workers, patients, visitors, target communities, and with other sectors.
Framework & process for action: **forthcoming tools to establish baselines** (i.e. vulnerability of HCFs and tool to assess carbon/env footprint)
**Example 3: INTERVENTIONS**

* Indicates interventions that are critical for resilience and sustainability.
Framework for climate resilient and environmentally sustainable health care facilities
Proposes interventions for climate resilience and environmental sustainability

Framework to assess climate change impacts and vulnerabilities in health care facilities
Provides checklists to identify and assess climate related impacts and vulnerabilities.
Reducing risks through

- Hazards
- Exposures
- Vulnerabilities
Climate change leads to hazards such as floods, storms, droughts, wildfires, extreme temperature, sea-level rise, and climate sensitive diseases. These hazards expose vulnerabilities including health workforce, building infrastructure, water, sanitation, waste, energy services, and communities. The underlying factors affecting these vulnerabilities are social, economic, environmental, and institutional. The impacts of these risks are critical, and resilience measures are needed to mitigate and adapt to climate change.
Objectives:

• to assist health care facility managers and staff to identify the main climate risks they face;

• to assess the main impacts by identifying the level of risk based on risk checklist tables; and

• to propose a set of questions that respond to the level of vulnerability of the HCF.

This work builds on WHO’ Operational framework for building climate resilient health systems (WHO, 2015), and WHO’s guidance for climate resilient and environmentally sustainable health care facilities (WHO, 2020).
